Project Abstract

Product Management Minor Project | ClueLearn Industrial Training and Internship Program | November 2026

Problem

College students buy textbooks, electronics, notes and room essentials, then stop needing them. Useful items may remain idle or be discarded while other students need affordable alternatives. CampusLoop explores a trusted, campus-only way to pass usable items between students.

Solution

CampusLoop is a campus-only exchange where verified students can buy, sell and donate pre-owned items. The proposed MVP includes student verification, listings with a donation option, search and filters, item details, seller contact, sold/given status and basic listing reports. In-app chat, saved items and campus meetup suggestions are planned for V2; an impact tracker and seller ratings are planned for V3.

Approach

The project follows the product-management lifecycle: discovery, user research, competitor analysis, product vision, requirements, RICE prioritization, wireframes, a clickable Figma prototype, roadmap, success metrics and go-to-market planning. Primary research combined an anonymous survey of 13 students with two first-year student interviews. Competitors and alternatives reviewed included OLX, Quikr, Facebook Marketplace and campus messaging groups.

Key Research Findings

Survey signal	Finding
66.7% (8/12)	Respondents kept unused items in their room or threw them away.
54.5% (6/11)	Selected textbooks or study materials as unused items.
53.8% (7/13)	Selected student ID verification as a trust-building feature.
92.3% (12/13)	Preferred a platform supporting buying, selling and donating.
23.1% (3/13)	Had bought a used item in the past year; 10 of 13 had not.

Outcome and Limitations

Deliverables include a PRD, 12 prioritized user stories, eight low-fidelity wireframes, a clickable prototype, phased roadmap, proposed pilot KPIs and go-to-market plan. The survey sample is small (n=13), weighted toward first-year students and day scholars, and individual questions received 11–13 responses. The two interviews are qualitative context, not representative evidence. The prototype has not been usability-tested, and the concept has not been launched.

Clickable prototype: Open CampusLoop Figma prototype | Proposed pilot targets are planning assumptions, not observed results.
