CAMPUSLOOP

Project Report

A campus-only platform for students to buy, sell, exchange and donate pre-owned items.

Product Management Minor Project

ClueLearn Industrial Training and Internship Program

Author: Anas Anjum

Submission date: 10 November 2026

Clickable Figma prototype: Open Figma prototype

Executive Summary

CampusLoop is a proposed campus-only marketplace designed to help students pass on useful items rather than leave them idle or discard them. Students can discover listings, sell or exchange items, and donate items to other students. The concept responds to two connected needs: students want affordable second-hand goods, while other students need a convenient and trustworthy way to pass on items they no longer use.

The project used an anonymous survey of 13 students and two student interviews. The sample is small and skewed toward first-year students and day scholars, so findings are directional rather than representative of an entire college. In the survey, 92.3% preferred a platform supporting buying, selling and donating; 53.8% selected student ID verification as a trust-building feature; and 54.5% of respondents to the unused-item question selected textbooks or study materials.

The project produced a PRD, competitor analysis, 12 prioritized user stories, eight low-fidelity wireframes, a clickable Figma prototype, a phased roadmap, a metrics framework and a go-to-market plan. The proposed MVP focuses on student verification, item listings, donation, search and filters, item details, seller contact, listing status and basic reporting.

Important limitation: the prototype has not been usability-tested, and the concept has not been launched. KPI targets are proposed pilot measures, not observed product performance.

Report contents

Section	Coverage
1. Introduction and problem	Context, purpose, objectives and scope
2. User research	Survey method, sample, findings and interview themes
3. Competitor analysis	Alternatives and differentiation
4. Product strategy	Vision, audience, goals and MVP boundaries
5. Requirements and prioritization	User stories, RICE and acceptance criteria
6. Prototype and design	Eight wireframes, core journey and design principles
7. Roadmap and metrics	Phased releases, North Star and proposed KPIs
8. Go-to-market and conclusion	Launch approach, risks, limitations and next steps
References and appendices	Research notes and supporting visuals

1. Introduction and Problem Definition

1.1 Background

Students purchase textbooks, electronics, notes, stationery and room essentials during their studies. When a semester ends, a course changes or a student moves, some items are still usable but no longer needed. Existing ways of passing them on—friends, informal messaging groups and general classifieds—can be fragmented, difficult to search and uncertain in terms of trust.

1.2 Project purpose and objectives

The purpose of CampusLoop is to take a campus exchange idea through a product-management process, from problem discovery to a launch-ready product plan and clickable prototype. Objectives: understand student needs; compare alternatives; define a product vision and MVP; write and prioritize user stories; design the main user journey; and propose a roadmap, success metrics and launch strategy.

1.3 Problem statement

College students need an easy and trustworthy way to buy, sell, exchange or donate pre-owned items within their campus. Today, students rely on informal networks or broad marketplaces, making it harder to find relevant items and feel confident about the person on the other side. Useful items can remain unused or be discarded while other students spend money buying new ones.

1.4 Scope

In scope	Out of scope for the MVP
Research, competitor analysis, vision, user stories, RICE, wireframes, clickable prototype, PRD, roadmap, metrics and GTM plan.	Production app development, payments, delivery, cross-campus marketplace, advanced moderation dashboard and live launch.

This is a product-management design project, not a claim that a production application has been implemented.

1.5 Lifecycle followed

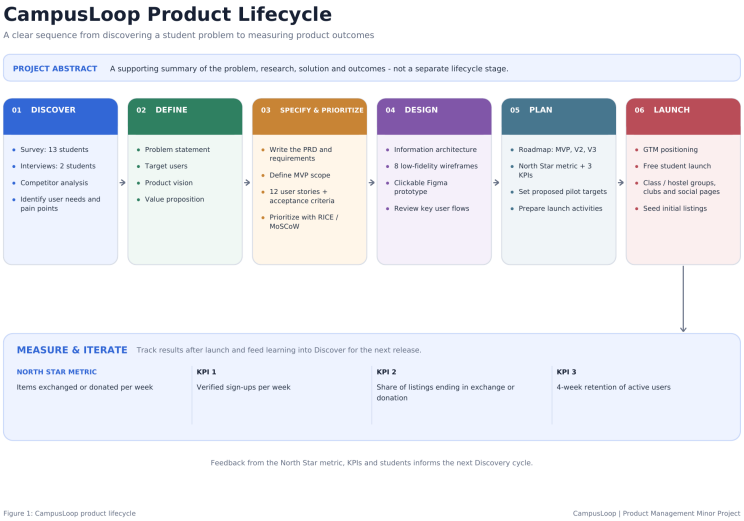

Figure 1: CampusLoop product lifecycle

CampusLoop | Product Management Minor Project

2. User Research

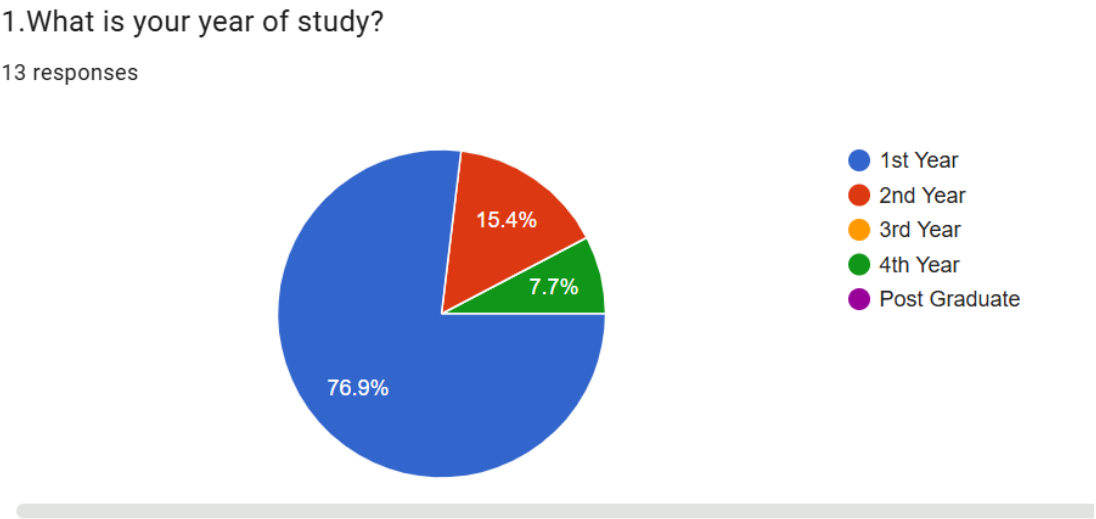

2.1 Research objectives and method

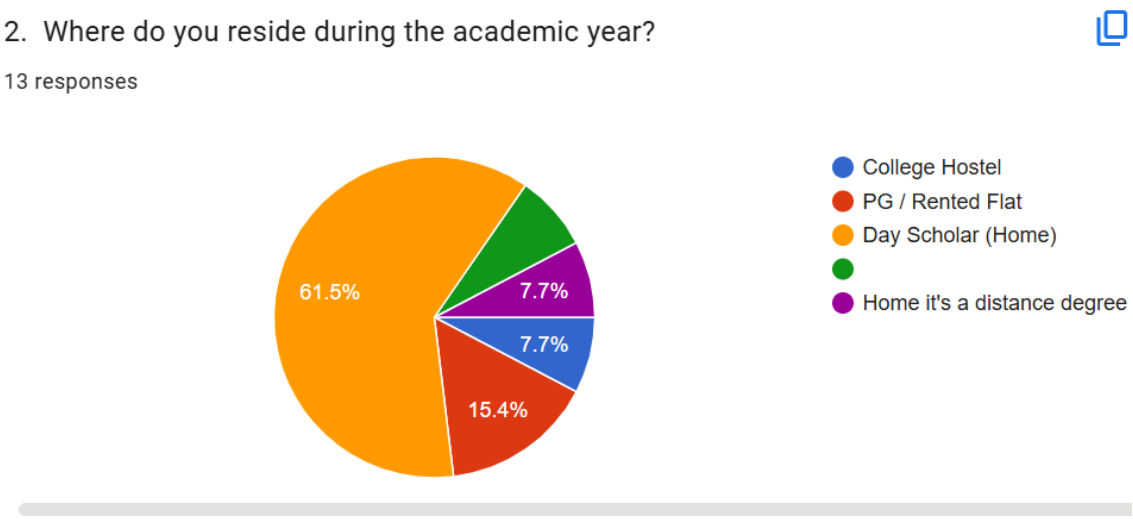

The research aimed to understand whether students have unused items, how they currently pass them on, barriers when buying or selling second-hand goods, which trust features matter, and whether students prefer one place for buying, selling and donating. Primary research consisted of an anonymous Google Forms survey and two short student interviews.

Method	Sample	Coverage
Online survey	13 students overall; individual questions received 11–13 responses.	Year of study, residence, second-hand buying, unused items, current practices, trust preferences and exchange model.
Student interviews	2 first-year students.	Affordability, item condition, trust, student verification, selling study materials and campus-based exchange.

2.2 Sample profile

Ten of 13 respondents (76.9%) were first-year students, two (15.4%) were second-year students and one (7.7%) was in fourth year. Eight (61.5%) were day scholars; two (15.4%) selected PG/rented accommodation and one (7.7%) selected college hostel. Other responses included a distance-degree response and an unlabeled/other category.

Figures 2–3. Survey respondent profile by year of study and residence (n=13).

2.3 Research limitations

The sample is small, not randomly selected, and weighted toward first-year students and day scholars. Some questions had fewer than 13 answers. The two interviews provide qualitative context but cannot establish how common a need is across the full student population. Findings are early discovery signals, not representative conclusions.

3. Survey Findings

3.1 Buying used items and unused inventory

Three of 13 respondents (23.1%) had bought used items in the past year; 10 (76.9%) had not. This suggests the concept may need to create awareness and confidence rather than simply redirect an established buying habit.

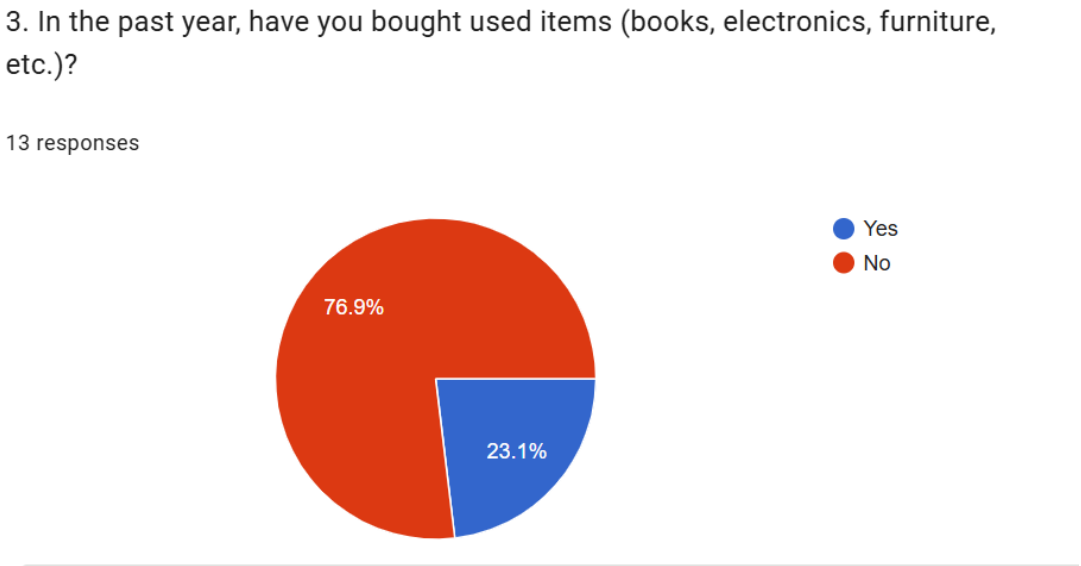

Figure 4. Whether respondents had bought used items in the past year (n=13).

Among 11 responses about items no longer needed, textbooks and study materials were the most frequently selected category (6 responses; 54.5%). Other categories were selected less often.

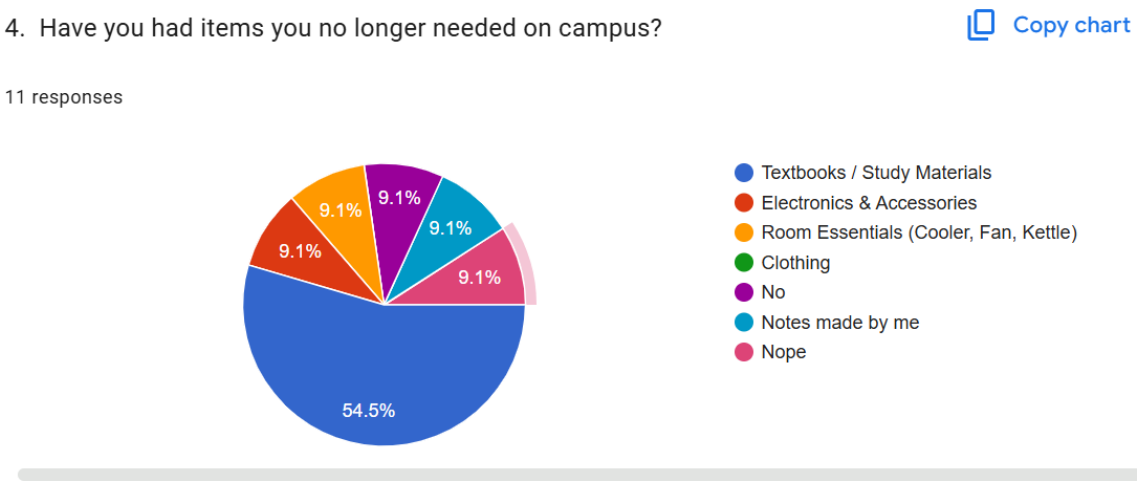

Figure 5. Types of unused items reported (n=11).

3.2 What happens to unused items

For the question about what respondents did with unused items (n=12), five (41.7%) kept them in their room and three (25.0%) threw them away. Two (16.7%) sold them, one (8.3%) donated an item and one (8.3%) gave an item to a friend. Eight of 12 (66.7%) therefore kept or discarded items.

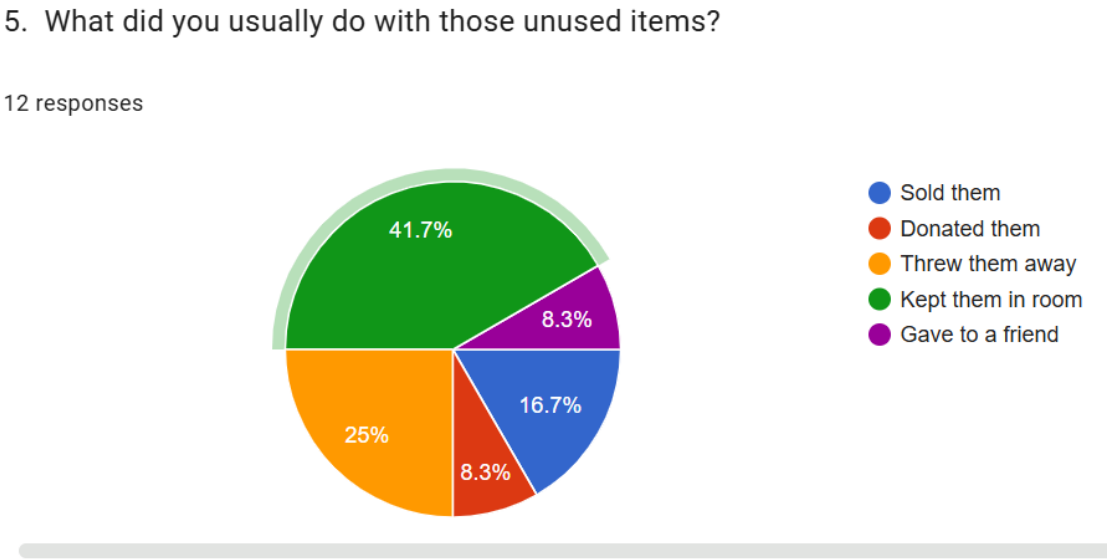

Figure 6. What respondents did with unused items (n=12).

4. Trust, Exchange Preferences and Interviews

4.1 Trust-building features

Seven of 13 respondents (53.8%) selected student ID verification, four (30.8%) selected in-app secure chat and two (15.4%) selected on-campus pickup spots. No respondent selected ratings/reviews in the displayed chart. Verification is treated as a foundational requirement.

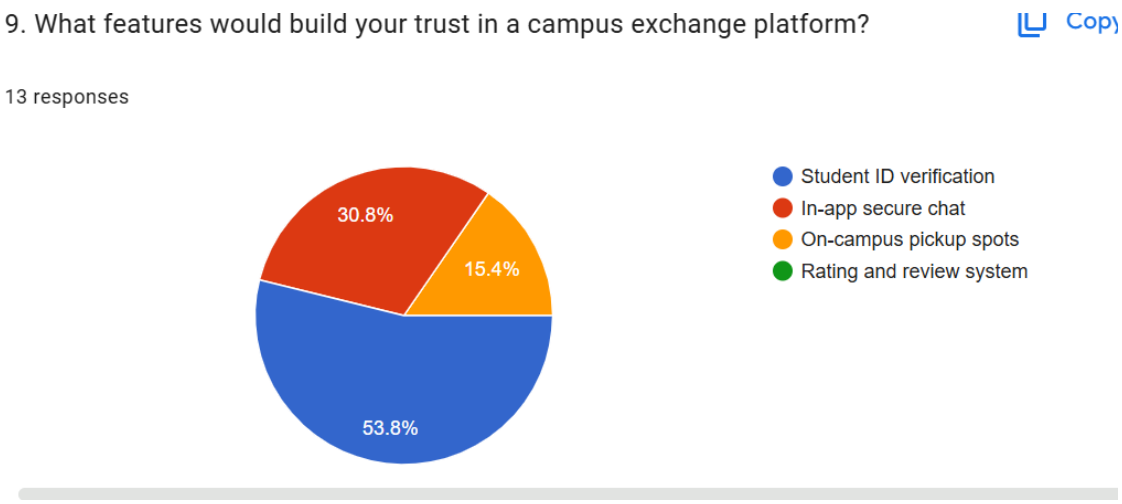

Figure 7. Preferred trust-building features (n=13).

4.2 Preferred exchange model

Twelve of 13 respondents (92.3%) preferred a platform supporting buying, selling and donating. One (7.7%) selected donate only. This supports a balanced exchange model with buying/selling and a visible donation option.

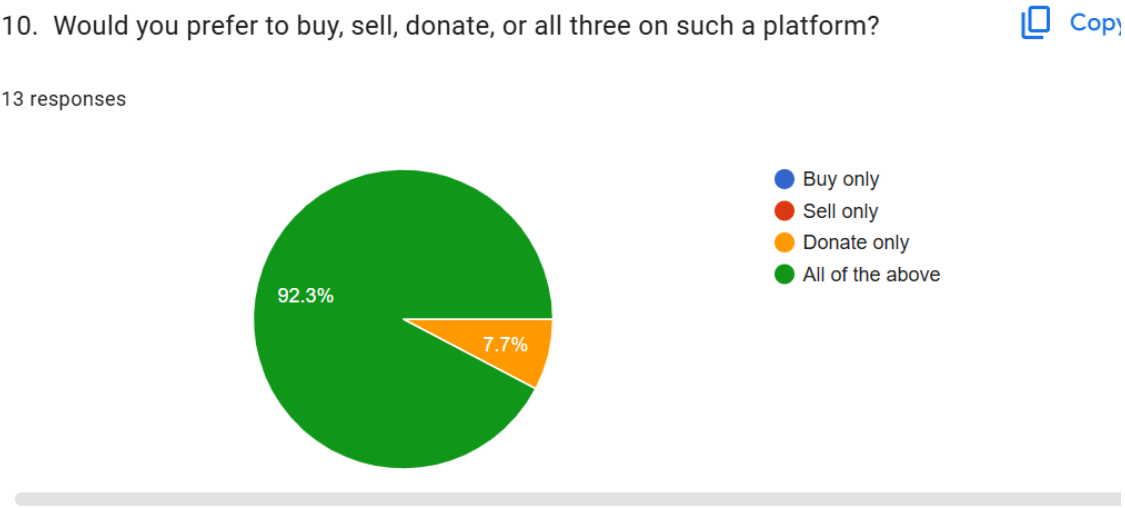

Figure 8. Preferred exchange model (n=13).

4.3 Interview themes

Theme	Interview finding	Product implication
Affordable academic materials	Both students described difficulty finding affordable books in good condition.	Prioritize books and study materials.
Trust and verification	Both preferred a student-only environment and considered college ID or email verification important.	Make verification visible.
Transparent listings	Students wanted clear photos, descriptions and item condition.	Require listing photos and condition.
Campus convenience	Participants preferred exchanging items with other students on campus.	Keep marketplace campus-specific.
Simple discovery	A straightforward category structure was preferred.	Use categories, search and filters.

These are themes from two interviews, not statistically representative findings.

5. Competitor and Alternative Analysis

Alternative	Strength	Limitation / gap	CampusLoop opportunity
OLX	Large audience and many categories.	General marketplace; campus context is not core.	Campus-only discovery and student verification.
Facebook Marketplace	Familiar social platform.	Not designed specifically for a college community.	Student-focused environment.

Alternative	Strength	Limitation / gap	CampusLoop opportunity
Quikr	Broad classified listings.	General-purpose experience.	Student categories and simple listing flow.
WhatsApp / Telegram groups	Free and familiar.	Listings get buried; limited structure and search.	Searchable listings and item status.
Keep / discard	Requires little effort.	Items may remain idle or be discarded.	Make reuse and donation easier.

5.1 Differentiation hypothesis

CampusLoop's proposed differentiation is the combination of a campus-only audience, student verification, structured listings, search and filters, and a built-in donate option. This is a hypothesis to test through a pilot, not a claim that competitors cannot offer any of these features.

5.2 Competitive learning

CampusLoop should not attempt to match the breadth of a national classifieds platform. It should deliver a focused experience for a small community where relevance, identity confidence and convenient hand-off matter more than a huge inventory.

6. Product Vision and Strategy

6.1 Product vision

A trusted campus-only exchange where students buy, sell, exchange and donate useful pre-owned items, so value stays within the student community and fewer usable items go to waste.

6.2 Target audience

Audience	Need / context	Design response
College students, including day scholars	Want affordable items or need to pass on items they no longer use.	Simple search, categories, listing information and low-friction posting.
New / first-year students	May be unfamiliar with where to find affordable books and trusted sellers.	Academic-material categories, verification cues and transparent item condition.
Students moving out / senior students	May need to pass on several items at semester end.	Fast listing and donation option; this segment needs more research.

6.3 Product goals

Help students find or pass on useful items within their campus; build trust through student verification and transparent listings; encourage reuse; and validate core exchange behavior with a lean MVP.

6.4 MVP scope and exclusions

MVP includes	Deferred / excluded
Student verification; create listing with photos; donate/free option; search and filters; item details; contact seller; mark sold/given; basic reporting.	Payments, delivery, cross-campus listings, advanced seller ratings, full admin dashboard. In-app chat, favorites and meetup suggestions are V2.

The initial product should be free for students. Monetization is not required to validate the MVP.

7. Requirements and Prioritization

7.1 Prioritized user stories

ID	Story summary	RICE	Release
US4	Buyer sees photos, condition and seller information.	20.0	MVP
US6	Student can donate items for free.	9.6	MVP
US2	Seller posts an item with photos and price.	9.0	MVP
US1	Student signs up using college email or student ID.	8.0	MVP
US3	Buyer searches and filters listings.	7.2	MVP
US9	Seller marks item sold or given.	6.0	MVP
US5	Buyer messages seller in app.	3.2	V2
US12	User reports suspicious listings.	2.4	MVP basic
US8	User selects safe campus meetup spot.	2.0	V2
US11	Buyer saves favorites.	1.6	V2

ID	Story summary	RICE	Release
US10	User sees impact / items saved from landfill.	1.25	V3
US7	Buyer sees seller ratings.	0.83	V3

RICE = (Reach × Impact × Confidence) ÷ Effort. Scores are estimates, not precise forecasts. Verification remains a gating requirement despite its score because it is central to the trust proposition.

7.2 Acceptance criteria

Feature	Minimum acceptance criteria
Verified sign-up	Valid college email or student ID completes verification; invalid entries receive an error.
Create listing	Title, category, condition and at least one photo are required; price may be omitted for donation.
Search and filters	Keyword search and category, price, condition and free-item filters work; empty results show suggestions.
Item details	Shows photos, description, condition, price, date, verified badge and campus area; no public phone number.
Status and reporting	Seller marks sold/given; reported listings are flagged for review.

7.3 Non-functional considerations

The PRD proposes search results within three seconds on a normal mobile connection, minimal personal data collection, no public display of personal contact details, and clear, readable mobile UI.

8. Prototype and Design

The design direction is modern, minimal and premium, with a mobile-first layout, clear hierarchy and a restrained color palette. Eight low-fidelity wireframes cover onboarding, discovery, search, item evaluation, seller contact, listing creation and profile management.

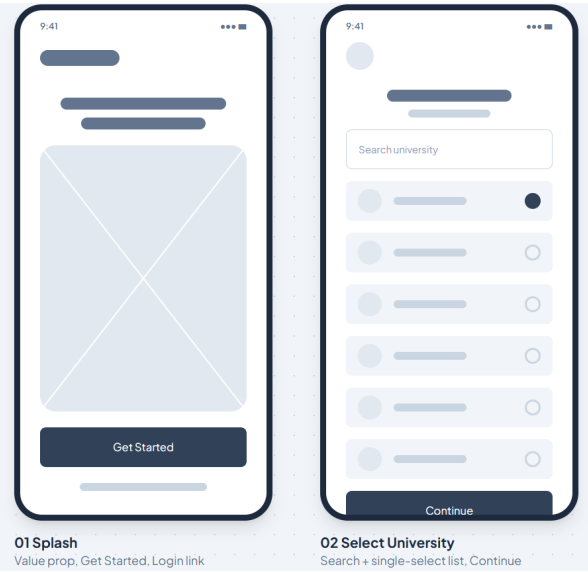

Figure 9. Screens 01–02: Splash / get started and select university.

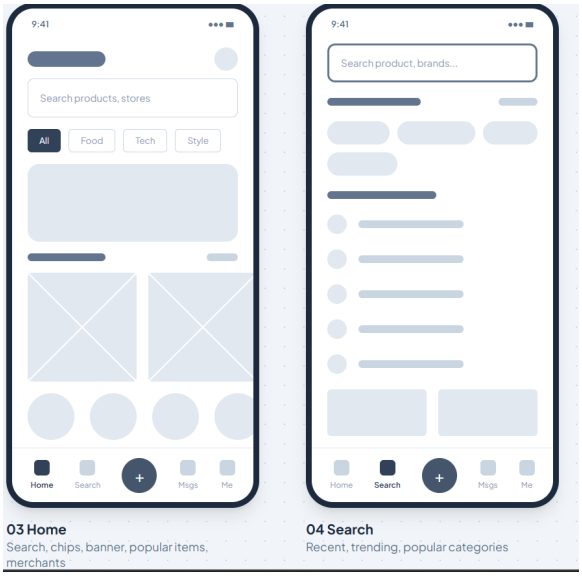

Figure 10. Screens 03–04: Home discovery and search.

8. Prototype and Design (continued)

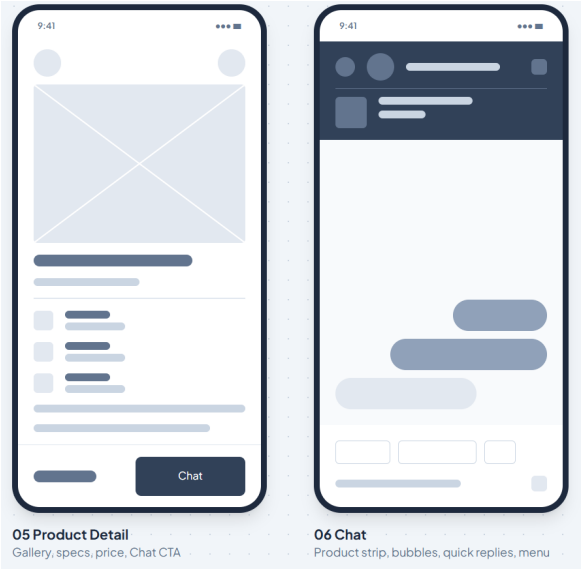

Figure 11. Screens 05·06: Product detail and chat/contact experience; chat is a V2 concept, not part of the MVP.

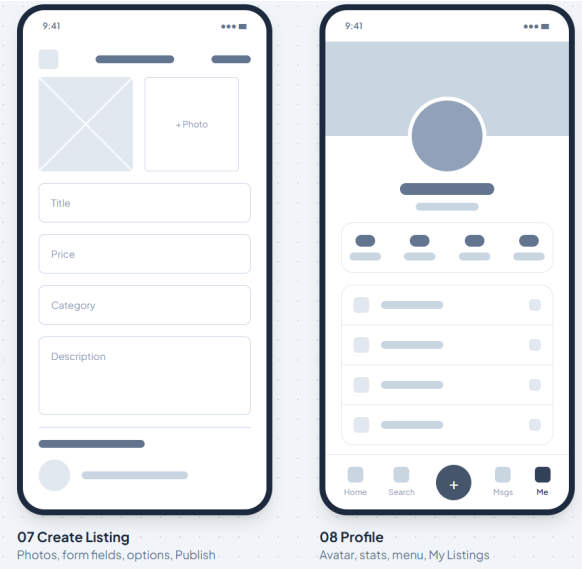

Figure 12. Screens 07·08: Create listing and profile; impact-tracker functionality is planned for V3, not the MVP.

8.1 Main user journey

Figure 13. Proposed user flow: verify student, browse or search, open item details, contact seller, and create a listing or donate.

8.2 Design principles and status

Make trust visible through student verification and transparent listings. Do not display personal contact details publicly. The clickable prototype has not yet been usability-tested.

Open the Figma prototype for review.

9. Roadmap and Success Metrics

Phase	Theme	Features	Purpose
MVP	Trusted exchange	Verification, listings, donation, search, details, contact, sold/given status, reporting.	Validate exchanges on one campus.
V2	Smoother exchange	In-app chat, saved items, campus meetup suggestions.	Reduce friction.
V3	Habit and trust	Impact tracker and seller ratings.	Support repeat use and trust.

9.1 North Star Metric

Pilot target: 2-3 completed exchanges or donations per week by Week 4; count confirmed exchanges only.

9.2 Supporting KPIs and proposed pilot targets

KPI	Definition	Proposed target*
Verified student sign-ups	New verified accounts per week.	5 per week during first four pilot weeks.
Listing completion rate	Published listings marked sold/given within 30 days.	At least 25% within 30 days.
4-week retention	Share of first-week active users who return for a meaningful action in week four.	At least 20%.

*Targets are planning assumptions for a small, single-campus pilot, not observed results. Review after the first month. Track: verified sign-up, listing created, listing viewed, seller contacted, listing marked sold/given and report submitted.

9.3 Validation status

Check	Status
30+ survey responses	Not met: 13 responses; limitation disclosed.
Student interviews	Completed: 2; further interviews recommended.
Competitor comparison	Completed: five alternatives.
User stories / RICE	Completed: 12 stories scored.
Wireframes and clickable prototype	Created; usability testing pending.
PRD and roadmap	Created; use corrected final versions.

10. Go-to-Market Plan, Risks and Conclusion

10.1 Positioning

For students who want affordable pre-owned items or need to pass on things they no longer use, CampusLoop is a campus-only exchange that connects students through verified access, searchable listings and a built-in donate option.

10.2 Initial channels

Channel	Launch activity	Purpose
Class / hostel groups	Share a short demo and sign-up information, subject to college rules.	Reach existing student communities.
College social pages	Posts showing how to list, find and donate items.	Build awareness.
Student clubs	Partner on a book and study-material exchange drive.	Seed listings.
Semester-end donation drive	Invite students to list or donate usable items.	Create initial inventory.
Word of mouth	Invite classmates from the same college.	Grow within campus.

10.3 Launch sequence

Pre-launch: recruit early student contributors and seed genuine listings. Launch: start with one college and emphasize books, study materials and free items. Post-launch: monitor exchanges, verification issues, reports and feedback; prioritize safety and listing quality.

10.4 Risks and mitigations

Risk	Mitigation
Low inventory	Seed listings and run a book or donation drive.
Fraud or unsafe hand-offs	Verify accounts, provide reporting and recommend public campus meetup locations.
Low adoption	Keep MVP lean, test the value proposition and adjust onboarding.
Privacy concerns	Collect only necessary data; do not display contact details publicly.
Moderation burden	Start with report-and-review and clear community rules.

10.5 Conclusion

CampusLoop addresses a plausible campus problem: useful items can remain idle or be discarded while other students need affordable alternatives. Early research indicates interest in a combined buy, sell and donate experience and highlights student verification as an important trust signal. The project translates these signals into a focused MVP, eight wireframes, a clickable prototype, prioritized requirements, a roadmap, metrics and a launch plan.

The evidence is preliminary. The survey had 13 respondents, the interviews involved two students, and the prototype has not been usability-tested or launched. Next steps are to test the prototype, gather additional feedback from underrepresented groups, confirm the college verification method and run a small single-campus pilot.
